

In the years 2002–2005, a group of German and Polish mathematicians worked under a DFG research project No 436 POL 113/98/0–1 entitled “Methods of stochastic analysis in the theory of collective phenomena: Gibbs states and statistical hydrodynamics”. The results of their study were summarized at the German–Polish conference, which took place in Poland in October 2005. The venue of the conference was Kazimierz Dolny upon Vistula – a lovely town and a popular place for various cultural, scientific, and even political events of an international significance. The conference was also attended by scientists from France, Italy, Portugal, UK, Ukraine, and USA, which predetermined its international character. Since that time, the conference, entitled “Infinite Particle Systems: Complex Systems” has become an annual international event, attended by leading scientists from Germany, Poland and many other countries. The present volume of the “Condensed Matter Physics” contains proceedings of the conference “Infinite Particle Systems: Complex Systems III”, which took place in June 2007.
